Interpersonal Relations in Nursing

Psychiatric Quarterly

Clinical studies in psychiatry. Schizophrenia as a human process. The fusion of psychiatry and social science

This text helps students and nurses to communicate effectively with their clients, peers and other healthcare members. This edition includes expanded sections on intercultural communication, family and group communication in a new two-column format.

Originally published in 1952 by a towering figure in nursing history, this book stresses the then novel theory of interpersonal relations as it was relevant to the work of nurses. Her framework suggested that interaction phenomena that occur during patient-nurse relationships have qualitative impact on patient outcomes. While the past four decades have seen a substantial expansion in the use and understanding of interpersonal theory, such as cognitive development and general systems theory, this classic book remains a useful foundation for all nurses as so much subsequent work used this work as its starting point. Springer Publishing Company is delighted to make this book available again.

Interpersonal Relations In Nursing

The Process of Interpersonal Communication

The second edition of this popular textbook continues to demonstrate the application of theory to nursing practice, presenting a clear strategy for choosing and applying specific theories to specific clinical situations. Each chapter follows a common format: a case is presented, along with several possible theories that might be applied to it. Each theory includes a concise description, with references and recommended readings for those who want more in-depth coverage. Finally one theory is selected for each case and is described in detail, ultimately creating a nursing care plan, with support from the theory. In all, nearly 10 middle-range theories are presented. New to this edition is a selection in each chapter about research supporting the theories discussed. In recognition that a case study format can not encompass all practice circumstances, the final chapter provides the framework for using the strategy in any clinical situation.

Aversive Interpersonal Behaviors

The British Journal of Social Psychiatry and Community Health

"How each person learns of his or her own uniqueness through interpersonal contact is the theme of this text for introductory interpersonal communication or communications courses. Its perspective is fresher and wider than most in introducing new topics as they relate to the traditional concerns of the course. For example, the chapter on perception includes a discussion of altered states of consciousness; the chapter on verbal and nonverbal communication includes discussions of laughter and swearing; and the chapter on socialization includes treatment of sexism. The communication perspective is also broadened by inclusion of chapters on cross-cultural and subcultural communication. Each chapter contains readings from a wide variety of sources as well as chapter objectives and probe questions."--Back cover.

Written specifically with the undergraduate professional nursing student in mind, here is comprehensive coverage of each phase of the nursing process, from assessment and diagnosis to care and evaluation of individuals and families. Its strong psychosocial approach makes the text applicable to various practice settings: hospital, community and psychiatric facilities. It covers the theoretical basis of the profession, including models of personality and intervention, cultural, legal and ethical issues. The text addresses specific topics such as skills of communication, therapeutic relationships, family and group dynamics, pharmacotherapy and more. It explores facets of normal social attachment, sexuality and development at each stage of the life cycle. In addition, the book addresses the role of nursing in crisis intervention, and covers the relationship of DSM III categories of psychiatric disorders to the nursing profession.

Combining psychiatric theory with a holistic approach, this text aims to enable students in psychiatric nursing to care for patients' physical, psychological, social and spiritual needs. It covers areas such as spiritual and religious issues, care of AIDS patients, adult development issues, losses, homelessness, loneliness and violence. The authors consider the total person, bringing together the latest biological advances, proven psychodynamic approaches, and spiritual and cultural interventions to help readers understand the many aspects of psychiatric nursing today. There are case studies, a chapter on mind-body-spirit therapy, and an integration of DSM-IV categories throughout.

Aversive behaviors have greater influence on social interactions than is generally acknowledged, determining personal satisfaction, interpersonal attraction, choice of partners, and the course of relationships. What motivates aversive behaviors? To what extent do they obtain desired outcomes? In what ways are they unnecessary and destructive? How do other people respond, emotionally and behaviorally? These are just a few of the many interesting questions addressed by the 16 respected researchers who contribute to Aversive Interpersonal Behaviors. Nine chapters give this heretofore neglected
subject the attention it is due, probing a dark side of interpersonal relationships to understand both its destructive and adaptive nature.
